Deep Learning

Assignment 1

7 points

1. Linear Softmax

a. [2 marks]

The output is as following: 0.9198

```
[[ 952 0 4
          2
             0
                8
                       4 0]
                     1
          2
[ 0 1106
        2
             0
                2
                  4 2 17 0]
    6 934
          8
             6 5 9 11 38 11]
    1 27 898 0 42 1 10 19
```

[1 1 10 1 867 2 11 3 14 72] [8 3 6 26 5 792 10 5 30 7]

[8 3 10 1 8 18 903 2 5 0] [3 5 22 8 5 2 0 940 3 40]

[4 4 7 21 7 29 9 10 876 7]

[8 5 2 10 12 10 0 19 13 930]]

Here are the misclassification with number of occurences>20: 2->8(38), 3->2(27), 3->5(42), 4->9(72), 5->3(26), 5->8(30), 7->2(22), 7->9(40), 8->3(21), 8->5(29).

We can see there is high rate for misclassification on 2->8, 3->5, 4->9, 5->8, 7->9, 8->5 etc. For example 4->9 is very common misclassification due to handwriting on 4. the same as 7->9 etc. 2 has many different handwriting style that is easily to be misclassified as 8.

b. [1 mark]

Given that there are $28 \times 28 = 784$ inputs and 10 outputs, total trainable params = (784+1)*10 = 7850 trainable params.

2. Two-Layer Neural Network

a. [1 mark]

After improving the code, the output is as following: 0.9789

[[968 0 2 0 0 4 1 [0 1128 2 1 1 01 1 0 1 7 [4 0 1005 5 1 1 4 11 0 0 3 995 1 1 0 2 4 4] 1 3 1 960 1 5 1 1 9] [5 1 12 1 860 6 0 5 2] 2 0 1 3 4 943 0 0 2 10 2 3 0 1 1 0 0 4 6 [4 1 0 7 3 2 3 4 948 2] 9 4 5 2 98211 0 4 1

The top five misclassifications: 5->3, 7->2, 9->4, 4->9, 8->3

Yes, these are the kinds of errors that humans might also make if digits were poorly written by taking a look at the images on chapter 6 of http://neuralnetworksanddeeplearning.com/chap6.html

b. [1 mark]

Assuming an MLP with 100 hidden nodes, calculate the total number of weights in (i) the hidden layer and (ii) the output layer, of the MLP model.

(784+1)*100 + (100+1)*10 = 79510 trainable params

c. [1 mark]

n_hidden=100: 0.9798, 0.9793, 0.9798 n_hidden=50: 0.972, 0.9728, 0.971 n_hidden=20: 0.9535, 0.9541, 0.9535

I also tried n_hidden=200 for once, with accuracy=0.9822.

We can see when n_hidden value decrease, the accuracy decrease too.

3. [1 mark]

Write the equations for each of these activation functions: sigmoid, tanh, ReLU

sigmoid: $S(z)=1/(1+\exp(-z))$

tanh: tanh(z)=(exp(z)-exp(-z))/(exp(z)+exp(-z))/(exp(z)+exp(-z))/(exp(z)+exp(-z))/(exp(z)+exp(-z))/(exp(z)+exp(-z))/(exp(z)+exp(-z))/(exp(z)+exp(-z))/(exp(z)+exp(-z))/(exp(z)+exp(-z))/(exp(z)+exp(-z))/(exp(z)+exp(-z))/(exp(z)+exp(-z))/(exp(z)+exp(-z))/(exp(z)+exp(-z))/(exp(z)+exp(-z))/(exp(z)+exp(-z))/(exp(z)+exp(-z))/(exp(z)+exp(-z))/(exp(z)+exp(-z))/(exp(z)+exp(-z))/(exp(z)+exp(-z))/(exp(z)+exp(-z))/(exp(z)+exp(-z))/(exp(z)+exp(-z))/(exp(z)+exp(-z))/(exp(z)+exp(-z))/(exp(-z)+exp(-z))/(exp(-z)+exp(-z))/(exp(-z)+exp(-z)+exp(-z)+exp(-z)+exp(-z)+exp(-z)+exp(-z)+exp(-z)+exp(-z)+exp(-z)+exp(-z)+exp(-z)+exp(-z)+exp(-z)+exp(-z)+exp(-z)+exp(-z)+exp(-z)+exp(-z)+exp(-z)+exp(-z)+exp(-z)+exp(-z)+exp(-z)+exp(-z)+exp(-z)+exp(-z)+exp(-z)+exp(-z)+exp(-z)+exp(-z)+exp(-z)+exp(-z)+exp(-z)+exp(-z)+exp(-z)+exp(-z)+exp(-z)+exp(-z)+exp(-z)+exp(-z)+exp(-z)+exp(-z)+exp(-z)+exp(-z)+exp(-z)+exp(-z)+exp(-z)+exp(-z)+exp(-z)+exp(-z)+exp(-z)+exp(-z)+exp(-z)+exp(-z)+exp(-z)+exp(-z)+exp(-z)+exp(-z)+exp(-z)+exp(-z)+exp(-z)+exp(-z)+exp(-z)+exp(-z)+exp(-z)+exp(-z)+exp(-z)+exp(-z)+exp(-z)+exp(-z)+exp(-z)+exp(-z)+exp(-z)+exp(-z)+exp(-z)+exp(-z)+exp(-z)+exp(-z)+exp(-z)+exp(-z)+exp(-z)+exp(-z)+exp(-z)+exp(-z)+exp(-z)+exp(-z)+exp(-z)+exp(-z)+exp(-z)+exp(-z)+exp(-z)+exp(-z)+exp(-z)+exp(-z)+exp(-z)+exp(-z)+exp(-z)+exp(-z)+exp(-z)+exp(-z)+exp(-z)+exp(-z)+exp(-z)+exp(-z)+exp(-z)+exp(-z)+exp(-z)+exp(-z)+exp(-z)+exp(-z)+exp(-z)+exp(-z)+exp(-z)+exp(-z)+exp(-z)+exp(-z)+exp(-z)+exp(-z)+exp(-z)+exp(-z)+exp(-z)+exp(-z)+exp(-z)+exp(-z)+exp(-z)+exp(-z)+exp(-z)+exp(-z)+exp(-z)+exp(-z)+exp(-z)+exp(-z)+exp(-z)+exp(-z)+exp(-z)+exp(-z)+exp(-z)+exp(-z)+exp(-z)+exp(-z)+exp(-z)+exp(-z)+exp(-z)+exp(-z)+exp(-z)+exp(-z)+exp(-z)+exp(-z)+exp(-z)+exp(-z)+exp(-z)+exp(-z)+exp(-z)+exp(-z)+exp(-z)+exp(-z)+exp(-z)+exp(-z)+exp(-z)+exp(-z)+exp(-z)+exp(-z)+exp(-z)+exp(-z)+exp(-z)+exp(-z)+exp(-z)+exp(-z)+exp(-z)+exp(-z)+exp(-z)+exp(-z)+exp(-z)+exp(-z)+exp(-z)+exp(-z)+exp(-z)+exp(-z)+exp(-z)+exp(-z)+exp(-z)+exp(-z)+exp(-z)+exp(-z)+exp(-z)+exp(-z)+exp(-z)+exp(-z)+exp(-z)+exp(-z)+exp(-z

RuLU: R(z) = max(0, z)
